

COMPLIANCE AGENTIC AI

Vendor Due-Diligence Gate

A deterministic compliance engine that gates vendor spend before the money moves — explainable, auditable, and human-accountable.

8 compliance controls

Full audit trail

Deploys unchanged to AWS

THE PROBLEM

Vendor spend gets approved by habit and memory — not by policy

No on-file sign-off

Invoices above the approval threshold go out because nobody is tracking thresholds transaction-by-transaction.

Screening gets skipped

A new vendor gets paid before anyone checks a sanctions list — screening is a step someone has to remember.

Unverified bank changes

A vendor "updates" payment details by email and it's applied unconfirmed — the classic business-email-compromise fraud vector.

Conflicts surface too late

An undisclosed relationship between requestor and vendor only comes out after the money has already moved.

THE SOLUTION

A deterministic gate stands between a transaction and the money moving

COVERAGE

Eight controls, one gate

Control	What it checks
Spend Approval	Approval thresholds; dual sign-off above a higher threshold
Vendor Due Diligence	Sanctions / watchlist screening for new or high-risk vendors
Jurisdiction Risk	Enhanced due diligence for vendors in high-risk jurisdictions
Conflict of Interest	Disclosure and compliance clearance before spend proceeds
Expense Receipts	Itemized documentation and amount reconciliation
Worker Classification	Misclassification risk for part-time / temporary engagements
Gifts & Hospitality	Anti-bribery pre-approval — zero threshold for government officials
Payment-Change Verification	Independent verification of vendor banking-detail changes

Every control cites the regulation or internal policy it enforces.

HOW IT WORKS

How a transaction moves through the gate

SEE IT WORK

From rule to decision, in one call

PROC-VENDOR-PAYMENT-CHANGE-001 — the same control guarding against business-email-compromise fraud

CASE-2029 from the seeded demo data, citing Barbados's Computer Misuse Act, Chapter 124B — every field name and value above is the engine's real output for this case.

SEE IT LIVE

Same control, four scenarios

Watching the gate decide, live, as the same transaction changes shape:

Vendor Due-Diligence Gate — live simulation, mirrors the real evaluator's logic

OUTCOMES

Four decisions, always explainable

APPROVED

Meets every rule — proceeds without delay

BLOCKED

Fails a control outright — spend stops here

INSUFFICIENT EVIDENCE

Missing documentation — more evidence required

HUMAN REVIEW

Ambiguous or high-risk — a person makes the call

Human oversight on every review

A manager assigns a reviewer, who starts and submits the decision with mandatory notes. Identity is checked at every step, and any completed review can be reopened with a documented reason. Four roles — employee, compliance analyst, compliance manager, auditor — govern who can do what.

GOVERNANCE

Built for audit from day one

Policy traceability

Every control cites the exact regulation or internal policy it enforces.

Escalation routing

Every decision computes who should be notified — Procurement, Legal, Finance — by risk band.

Governance dashboard

Per-control decisions, risk-signal frequency, and pending notifications in a single view.

Append-only audit trail

Every decision and review action is logged immutably, with actor and timestamp.

WHY IT MATTERS

The cost of unmanaged vendor risk is real — and avoidable

Stops fraud before it pays out

Gated before the money moves, not reviewed after — including the business-email-compromise pattern behind most payment fraud.

Reduces real legal exposure

Anti-bribery breaches alone carry penalties up to BBD \$1.5M or 15 years imprisonment under Barbados law.

Always audit-ready

Any decision can be reconstructed — what rule, what evidence, what outcome — on demand.

Scales without headcount

One rule catalog, eight controls — consistent enforcement as vendor volume grows.

UNDER THE HOOD

Same code, either environment

SEE IT RUN

What actually happened when we ran it

12 seeded transactions, evaluated locally against the real engine — this is /dashboard/summary's live response, not a mockup.

Vendor Due-Diligence Gate — real output from this run, not illustrative

WHAT'S NEXT

From working system to production rollout

- ✓ Deploy to a live AWS account and provision the first compliance manager
- ✓ Wire escalation routing to a real channel — email or Slack
- ✓ Confirm remaining regulatory questions and extend coverage beyond Barbados/Caribbean

Deterministic rules where rules are enough. Human judgment where they aren't. A permanent record either way.
